# Definitions and Abbreviations

**Cost-burdened Households** – The US Department of Housing and Urban Development (HUD) established the term “cost-burdened” to describe households that need more affordable housing. HUD defines cost-burdened households as “families who pay more than 30% of their income for housing... and may have difficulty affording necessities such as food, clothing, transportation, and medical care.” **Severely cost-burdened** households pay 50% or more of their income for housing and are likely to be making tough choices between housing and other necessities.

**Elderly/Senior Residents** – Age thresholds for elderly and senior residents vary based on the specific purposes of the program’s dataset. HUD provides a customized look at housing issues for specific household types, including the elderly. HUD defines elderly residents as those aged **62 and over** with further distinctions made between age groups. The American Community Survey (ACS), which is used for a broader range of programs including Medicare, uses a higher threshold, with seniors defined as **65 or older**.

**Energy-burdened Households** – Energy burden is the percentage of household income spent on energy costs, which includes utilities like electricity and heating fuels. It is calculated by dividing the annual utility bills by the annual household income. A household with an energy burden of 6% or higher is generally considered to have a high energy burden, while those with an energy burden over 10% have a severe burden.

**Householder** – This report refers to “householder” when the available data pertains to the householder as defined by the US Census. According to the Census subject definitions, “the householder refers to the person (or one of the people) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the ‘reference person’ to whom the relationship of all other household members, if any, is recorded.”

**Housing Affordability** – Housing affordability is a broad term used to discuss the degree to which housing units in a market or submarket meet the income-based needs of households in that market. Researchers and practitioners generally consider housing affordability for income groups that may face challenges related to affording housing, including the following:

- extremely low-income households that do not make enough money to obtain decent housing
- young professionals who wish to become homeowners but cannot find a starter home with associated costs within their budget
- established owners who cannot find an appropriate home to “upgrade” to as their families grow and they enter their professional prime

Housing affordability is not usually a concern for higher-income households that can obtain their desired housing without sacrificing other household needs such as safety, transportation, medical care, food, education, and

childcare. However, a shortage of housing for households at any income level may affect businesses expanding in the market or economic development efforts for attracting new businesses.

**Oxford Homes** – Oxford House is a self-run, self-supported home designed for individuals recovering from substance use disorders. It provides a supportive and sober living environment where members share responsibilities and support each other in their recovery journey.

**Percent of Area Median Income (AMI)** – HUD sets income limits by household size that determine eligibility for assisted housing programs. HUD develops these income limits based on Median Family Income estimates and Fair Market Rent area definitions for each metropolitan area, parts of some metropolitan areas, and each non-metropolitan county. These income limits are useful tools for housing needs assessments because they are a common standard with which to categorize households based on income considering household size.

**2023 HUD Income Limits for West Virginia**

*Source: FY23 HUD Income Limits\**

Income Level	1-person	2-person	3-person	4-person
<30% AMI (extremely low income)	\$15,000	\$17,150	\$19,300	\$21,400
30–50% of AMI (very low income)	\$25,000	\$28,550	\$32,150	\$35,700
50–80% of AMI (low income)	\$40,000	\$45,750	\$51,450	\$57,150

\*HUD Income Limits are calculated by household size for extremely low (income less than 30% of AMI), very low (30-50% of AMI), and low (50-80% of AMI) income levels based on the median income for a family of four in fair market rent areas. These percentages are based on programmatic formulas and are adjusted to ensure that all households living below the national poverty line are included in the extremely low-income category.

**Section 515 USDA** (US Department of Agriculture) Rural Development program provides essential financing for affordable rental housing in rural areas, primarily benefiting low-income families, elderly individuals, and persons with disabilities.

**Section 518 USDA** Rural Development program provides funding for the construction of multifamily rental housing for low to moderate-income families and individuals.

**Tenure** – The method by which a household possesses their home: renting, fully owned with no home loan, or owned with a mortgage or other home loan.

## Abbreviations

ABHC	Appalachian Behavioral Health Center
ACS	American Community Survey
AIAN	American Indian and Alaska Native
AMI	Area Median Income
BLS	Bureau of Labor Statistics
CHAS	Comprehensive Housing Affordability Strategy
CPI	Consumer Price Index
FHA	Federal Homeowners Association
HOME	HOME Investment Partnerships Program (HUD)
HUD	US Department of Housing and Urban Development
LIHTC	Low-income Housing Tax Credit
ND or --	No data
NHPD	National Housing Preservation Database
OHFLAC	Office of Health Facility Licensure and Certification
PI	Native Hawaiian or Other Pacific Islander
PPR	Persons per room
PUMA	Public Use Microdata Areas
VCHR	Virginia Center for Housing Research at Virginia Tech

## Additional Terms for Appendix IV Housing Vulnerabilities by Vintage and Component

AMI	Average Median Income
Conf	Confidence
CV	Coefficient of Variance
Est	Estimate
GIS	Geographic Information System
HEC	High Energy Cost
HH	Houshold
LIEB	Low Income Energy Burdened
PUMA	Public Use Microdata Area
RPDC	Regional Planning and Development Council

## Additional Terms for Appendix V Housing Assets

### Abbreviations

RCCAA	Raleigh County Community Action Association
RCCR	Religious Coalition for Community Renewal
W, WC	Women, Women and Children
WV CORR	WV Community Outpatient & Residential Recovery
YWCA WIND	Women Inspired in New Directions - A non-treatment recovery home that offers peer support and case management for women in recovery seeking a "New Direction" for their lives that is addiction free.

### Admission Requirements

Level 1	Minimum qualification for admission. It is a Substance Use Disorder (SUD) or Alcohol Use Disorder (AUD), and non-clinical services are provided.
Level 2	Offers a higher level of support, including more comprehensive services and clinical programming.
Level 3	Provides the most intensive support, including formal clinical programming and specialized services.
Level 4	Offers the highest level of support, including specialized clinical services and a focus on long-term recovery.

# Appendix I: Unmet Need

### Renters <60% AMI Cost Burdened

## Housing Cost Burden by Income by Tenure by Region

Source: VCHR Tabulation of CHAS 2017-2021

NOTE: The entries in RED were constructed by VCHR from 2019-2023 Public Use Microdata Samples. Percentages of households at the 50-60% AMI Affordability Level are assumed to be evenly distributed across the counties within a given PUMA. The tabulated values in RED do NOT represent actual survey responses collected by the US Census Bureau, but instead represent an estimation calculated according to this assumption.

### Units by Tenure by Affordability Including Estimated 50-60% AMI

Source: CHAS 2017-2021 (5-year estimates) Tables 8, 14A, 14B, 15A, 15B, 15C

Note: The entries in RED were constructed by VCHR from 2019-2023 Public Use Microdata Samples. Percentages of households at the 50-60% AMI Affordability Level are assumed to be evenly distributed across the counties within a given PUMA. The tabulated values in RED do NOT represent actual survey responses collected by the US Census Bureau, but instead represent an estimation calculated according to this assumption.

Note: The tabulated estimates were calculated based on PUMA-level data. Percentages of households built within year ranges (with and without children present) are assumed to be evenly distributed across the counties within a given PUMA.

# Appendix IV: Housing Vulnerabilities by Vintage and Component

## Housing Vulnerabilities by Vintage and Component

This literature review is included as an appendix to provide additional information regarding housing vulnerabilities by vintage. It supports the main report by adding context and detail to concerns related to aging housing stock which are referenced in each of the regional chapters. This level of detail is not essential to the flow of each individual chapter but is necessary to include for readers to understand the causes and patterns of housing vulnerabilities by vintage.

Homes need regular maintenance and periodic upgrades. Upgrades, modernizations and replacements, are typically needed every 10-15 years. In addition to regular maintenance and upgrades, some vintages of housing present unique risks because of the materials used in their construction or the construction practices used at the time. As localities and homeowners consider investments in homes across West Virginia, structural risks should be an important component of that consideration. Units that need significant investments in rewiring or replumbing or that have rot due to structural problems may be less suitable for rehabilitation and renovation and more appropriate for replacement.

The stewardship of the housing stock (renovation and rehabilitation, demolition, new construction, regular maintenance and upgrade) has generally resulted in increasing housing quality since the 1970s. According to a study of American Housing Survey (AHS) data, 27% of the housing stock between 1973-1975 reported leaks in the basement compared to 11% between 2001-2005 (Eggers & Thackeray, 2007). In the AHS, housing units are objectively rated as adequate, moderately inadequate, or severely inadequate based on the presence of physical defects and the frequency of occurrence of breakdowns of the plumbing, heating, and electrical systems. In 1975, roughly 5% of all housing units in the United States were rated severely inadequate; by 1997, that figure had fallen to around 2% (Orr & Peach, 1999). Further studies utilizing AHS responses and indexes of poor quality find similar improvements. The percentage of housing stock rated moderately or severely inadequate has decreased 3.3% between 1985 and 2009. At the same time, the percentage of units with some deficiency decreased steadily from 52.7% to 44.5% (Eggers & Moumen, 2013). In recent years, the tightening housing market and increasing sale prices should encourage investment in housing writ large, however homeowners with tight-budgets and little savings may not have the means to make investments and tight rental markets may discourage investments in rental properties.

In addition to physical improvements, there have been notable changes in housing-related health outcomes. The relationship between housing conditions and health has been extensively studied, with findings indicating that better housing quality has contributed to reduced rates of lead poisoning, respiratory issues, and other health problems (Jacobs et al., 2008). For instance, improvements in heating systems and reduced exposure to environmental toxins have been linked to lower rates of respiratory illnesses and cardiovascular problems (Health & Housing Starter Kit, 2018).

However, certain types of housing have shown vulnerabilities to disasters and general deterioration. For instance, during the 1970s, an energy crisis led to building practices that emphasized heavy insulation and tightly sealed homes. These practices were later found to cause condensation and rotting of wood structures, posing a significant risk to housing durability (Bonney, 2007). Toward the end of the 1970s, new house prices and related

housing costs had risen sharply, and builders began to scale back severely the average size and quality of new units to make them affordable. (Adams, 1987, 72) Combined with innovations in building science, Hurricane Andrew in the early 1990s further highlighted the need for improved building codes, which subsequently led to changes in nailing patterns and insulation standards to enhance the resilience of homes against natural disasters (Schnoor, 2016).

Housing quality in the United States has evolved significantly since the 1970s, addressing various vulnerabilities and introducing improvements in building practices, materials, and health outcomes. This refinement focuses on the key issues and advancements in housing quality and construction.

Historically, timber frame connections have relied on the craftsmanship of carpenters to ensure the stability and durability of the joints. The use of specific nailing patterns and techniques was crucial to this process (Jorissen et al, 2016). Modern construction practices have evolved to include the use of computerized milling to create precise and robust timber connections. This technology allows for the efficient production of complex joints that can withstand significant forces and environmental pressures (van Nimwegen & Latteur, 2023). The incorporation of these advanced techniques helps to mitigate the vulnerabilities of wooden structures, such as susceptibility to rot and pressure-induced failures.

Proper nailing patterns are crucial for ensuring the structural integrity of buildings, especially in areas prone to natural disasters. Appropriate nailing patterns can significantly enhance a building's ability to withstand high winds and seismic activity. For instance, proper sheathing nailing patterns help distribute loads evenly and prevent structural failures during extreme weather events (HP Engineering, 2024).

Insulation practices have evolved with materials like Dryvit used for exterior insulation and finish systems (EIFS). Dryvit offers excellent insulation properties, but it must be correctly installed to prevent water infiltration, which can lead to mold growth and structural damage. Adherence to proper installation techniques and manufacturer guidelines is crucial for long-term performance (Sanders & Robinson, 2013).

Disasters such as hurricanes and floods have exposed weaknesses in housing construction, particularly related to rot and pressure. Moisture exposure can cause rot in wooden structures, leading to a loss of structural integrity over time. Poor ventilation and inadequate moisture barriers exacerbate this issue. Wind and water pressure during storms can further compromise structures, underscoring the need for robust building codes and construction practices (NOAA, 2024).

### *Mobile Homes*

Manufactured housing, sometimes called "mobile homes," is an important part of the housing stock and is particularly important in the supply of affordable housing for low-income Americans. The Manufactured Home Construction and Safety Standards Program (HUD Code) established national design, performance and installation standards for manufactured homes built after June 15, 1976 ("Manufactured Home Construction and Safety Standards," 2015). In 1994, the HUD Code energy standards were updated, raising minimum insulation requirements and mandating whole house ventilation (Kriger, 1998). Homes built to these standards tremendously outperform their nonconforming counterparts in quality, energy use and safety (Manufactured

Home Construction and Safety Standards 24 CFR 3280). Mobile homes built prior to 1976 are considered the “worst housing stock” in America by affordable housing advocates and industry representatives (Vaughan & Patterson, June 2009). These homes suffer from leaking roofs, dangerous or inefficient heating sources, lack of insulation and deteriorating foundations (Cody, 2011; Vaughan & Patterson, June 2009). Replacement of these mobile homes is often recommended over retrofitting because energy efficiency construction through building practices and materials is more cost-effective than weatherizing existing homes.

### *Hazardous Components*

Beyond overarching changes in building practices and despite increasing quality some housing retains hazardous components. Some of these components such wiring and plumbing would require significant investment to replace and may be a barrier to renovation or rehabilitation. Some examples are described below.

Early 20th-century homes were primarily equipped with knob-and-tube wiring, which, while innovative for its time, posed several safety risks due to their lack of grounding and insulation deterioration over time (“History of Residential Wiring Practices in the USA, David A. Dini P.E.”). As housing needs and technologies advanced, aluminum wiring became popular in the 1960s and 1970s due to its lower cost and abundance. However, this material was later found to be prone to overheating and potential fire hazards (David A. Dini P.E.). Another critical issue in housing safety emerged with the widespread use of Federal Pacific Electric (FPE) breaker boxes. Despite their initial reliability, FPE panels were later discovered to fail at alarming rates, leading to severe electrical hazards (“Hazardous FPE Circuit Breakers”, J. Aronstein, 2007). In addition to electrical concerns, the use of lead-based materials has had a lasting impact on housing quality. Lead paint, commonly used until it was banned in 1978, poses significant health risks, particularly to children, due to its toxicity and potential for lead poisoning (“Emerging Pathways to Upgrade the US Housing Stock”, Brennan et al 2021). Similarly, lead pipes, often used in plumbing systems, can contaminate drinking water, leading to severe health consequences (EPA, Brennan et al 2021). These historical practices underscore the importance of continuous improvement and regulation in housing construction to ensure safety and health for occupants.

### **Knob and Tube Wiring**

Knob and tube wiring, prevalent in homes from the 1880s through the 1940s, is considered a significant safety hazard today. This type of wiring is often found in older homes and is dangerous for several reasons. Firstly, it lacks a ground wire, which modern electrical systems require to safely operate today's high-power appliances and devices. The absence of grounding increases the risk of electrical shocks and fires (U.S. Department of Housing and Urban Development). Additionally, the rubberized cloth insulation used in knob and tube wiring deteriorates over time, leading to exposed wires and increased fire hazards (The Home Inspector's Notebook). Furthermore, improper modifications and the installation of higher-ampage fuses by unqualified individuals exacerbate these risks, making this outdated wiring method particularly dangerous (InterNACHI). According to the U.S. Consumer Product Safety Commission, such outdated wiring systems are not designed to handle the electrical load of modern appliances, increasing the risk of overheating and fire (History of Residential Wiring Practices in the USA, 2006).

## Aluminum Wiring

Aluminum wiring, used in residential construction primarily during the 1960s and 1970s, presents several safety concerns. Over time, aluminum wiring can oxidize and deteriorate, leading to poor connections and increased resistance. This resistance generates heat, which can cause the insulation to melt and potentially start fires (Consumer Product Safety Commission, 2019). Additionally, aluminum wiring is more prone to physical damage, such as breaks and nicks, which further increase the risk of electrical hazards. The expansion and contraction of aluminum with temperature changes can also lead to loosen connections, another fire risk (National Fire Protection Association, 2021). Homeowners with aluminum wiring should consider having their electrical systems inspected and updated by professionals to mitigate these risks.

## Federal Pacific Breaker Boxes

Federal Pacific Electric (FPE) breaker boxes, installed in millions of homes between the 1950s and 1980s, are notorious for their safety issues. Studies have shown that FPE breakers fail to trip during power surges or short circuits, significantly increasing the risk of electrical fires (U.S. Consumer Product Safety Commission, 2020). The failure rate of these breakers is alarmingly high, and even when they appear to be functioning correctly, there is no guarantee that they will provide adequate protection. As a result, many electricians and safety experts recommend replacing FPE breaker boxes with modern, reliable alternatives to ensure home safety (U.S. Consumer Product Safety Commission, 2011).

## Lead Paint

Lead paint, commonly used in homes built before 1978, poses severe health risks, particularly to children. Lead exposure can lead to developmental issues, learning disabilities, and various health problems (Environmental Protection Agency). The primary danger of lead paint is in the deterioration process; as the paint chips or turns to dust, it can be ingested or inhaled, leading to lead poisoning. Homeowners should take steps to remediate lead paint by hiring certified professionals to safely remove or encapsulate the lead-based paint (Centers for Disease Control and Prevention, 2021).

## Lead Pipes

Lead pipes and plumbing fixtures, commonly used in older homes, are a significant source of lead contamination in drinking water. Lead exposure from drinking water can cause numerous health problems, including neurological damage and developmental delays in children (Centers for Disease Control and Prevention, 2021). Lead pipes can corrode over time, releasing lead particles into the water supply. It is essential for homeowners with lead plumbing to replace these pipes with safer materials and use certified filters to reduce lead levels in their drinking water (Environmental Protection Agency, CDC, 2021).

# Appendix VIII: Projected Households and Housing Needs, 2028–2038

# Methodology Used to Estimate Future Housing Needs

## 1. Introduction and Justification

This appendix includes the full results of a household projection analysis for each of West Virginia's 55 counties. The analysis projects households, segmented by income and tenure, in the years 2028, 2033, and 2038 for each county, and compares these figures to existing housing inventory. While these projection tables are not included in the main body of the report, they accompany the current housing needs described in each of the regional chapters. These long-term projections segmented by income and tenure provide context for planners and policymakers to better understand the potential development of housing gaps over time.

This appendix also provides a detailed description of the methodology used for the household projection analysis and includes the full results of the analysis. The inclusion of methodology ensures transparency in the research process and allows readers to evaluate the validity of the approach. The expanded explanation provided here documents all data sources, assumptions, and analytical procedures, allowing for the results to be replicated.

## 2. From Population Projections to Households

We used projected population data for each county in 2028, 2033 and 2038. To convert population into household estimates, a "headship rate" is used. Two approaches can be used for deriving a headship rate:

- Using average household size in ACS
- Using (total population) / (total households)

The latter one often slightly higher than household size because the average household size is (total population in household) / (total households).

Given that the population forecasts are based on total population, this analysis employs (total population) / (total households) to calculate a baseline (2023) headship rate.

## 3. Projecting Changes in Headship Rates

### *3.1 Regression Model*

Headship rates are expected to change over time due to shifts in demographic structure. In order to capture these changes:

- Dependent Variable: County-level headship rate.
- Independent Variables: Male and female population in five age brackets (0–19, 20–39, 40–59, 60–79, 80+). This yields 10 total demographic variables (2 genders × 5 age groups).

- Rationale: Restricting the independent variables to 10 helps preserve degrees of freedom and maintains the statistical viability of the regression model.

Using this model, headship rates were estimated for each county in West Virginia, based on the demographic compositions projected for 2028, 2033, and 2038.

### *3.2 Model Bias and Adjustment*

Because the model does not account for factors such as urbanization or industrial structure (also to conserve degrees of freedom), it may yield predictions that deviate from actual observed values. To mitigate this:

- The ratio of the observed 2023 headship rate to the model-predicted 2023 headship rate was calculated.
- This ratio (adjustment factor) was applied to the model's estimated headship rates for 2028, 2033, and 2038.
- This procedure produces adjusted headship rates that reflect the baseline 2023 conditions more accurately.

## **4. Projected Households**

After adjusting the headship rates, the next step is to convert the population projections into household estimates for the target years (2028, 2033, and 2038). Preliminary results indicate that even though the total population is projected to decline in many counties, the number of households may decrease at a slower pace—or, in some instances, remain steady or increase—due to evolving demographic patterns (e.g., smaller average household sizes, aging population structures).

## **5. Distribution by Income and Tenure**

To better understand the composition of projected households, these household estimates are further disaggregated by income category and tenure.

- Income Categories: Defined in relation to the Area Median Income (AMI), using data from the 5- year 2021 Comprehensive Housing Affordability Strategy (CHAS).
- Tenure: Owner-occupied versus renter-occupied households.

Existing distribution patterns (from 2021 CHAS) serve as the basis for allocating the projected households across different AMI segments and tenure categories.

## **6. Comparison with Existing Housing Stock**

### *6.1 Data on Current Housing Stock*

2021 CHAS Data: Provides the baseline for existing housing units.

Vacant Units: Excluded from this analysis due to inconsistencies or anomalies in the reported vacancy data.

### *6.2 Housing Gaps and Shortfalls*

By contrasting the projected number of households (for 2028, 2033, and 2038) with the current housing inventory (adjusted 2021 figures), potential surpluses or deficits in housing stock can be identified for each county. This gap analysis assists in pinpointing counties with a higher risk of unmet housing needs in the coming years.

## **7. County-Level Results**

The county-level tables (tab 1 to 55) provide:

- Projected Households for 2028, 2033, and 2038, segmented by tenure (owner vs. renter) and AMI categories.
- Comparison to 2021 Housing Stock: Each table highlights the difference between projected households and existing housing units in 2021, offering a view of the potential gaps for each demographic segment.

## **8. Conclusion**

This methodology provides a structured approach to forecasting housing needs in West Virginia. By accounting for demographic shifts through regression analysis and adjusting projections to align with observed 2023 data, a more accurate estimate of future households can be derived.

### **Key Takeaways:**

- Headship rates evolve with demographic changes and require careful adjustment to align with observed conditions.
- While population levels may decline, household formations do not necessarily follow the same trajectory.
- Breaking down projected households by income and tenure allows for more targeted policy and planning measures.
- Comparing future household projections to current housing stock highlights where critical gaps may emerge.
- Ongoing refinement of the model, including consideration of additional variables (such as urban characteristics or economic conditions), may improve accuracy further as more data becomes available. However, this document provides a solid foundation for understanding and projecting housing needs across West Virginia's 55 counties.

### Projected Change in Households by County, 2023-2038
